## GLOBAL ECS REPORTING JOB EVENTS BY WRITING TO EXTERNAL FILES

Global ECS can write job event notifications to external files. This can be helpful when using separate system management software to monitor jobs or job statuses. GECS can write its messages to those external systems via user specified files. GECS can replace files or append to an existing file. When configured at the job level, all events generated for the job will be written to the file.

Let's say you need GECS to write to your system management software when a job has a failure. Follow the steps below:

1. Open your GECS Administrator program and go to the Event Definitions module. Edit Event Definition #56 - Bad Return Code will be used for this example. Likewise, any other event definition could be set up this same way. Click on the "Mail" tab. Update the "Send Mail To:" fields.

GlobalECS - Administrator	[ Version 4.70.08	83-Win64 ]					
🛃 Home	File View	Help					
🦲 Jobs	Add User Event Definition C 🐨 🗙 @ 🛆						
Batches							
SLA Monitor	Number						
Job Templates	50 Yes 🖾 Job late.						
Studio Worksheets	51	51 No Job start.					
Calendars	52	Yes 🔤 🛛 Job retry.					
Resources	54 Yes 🖂 Job complete.						
Variables	▶ 56 Yes 🖾 Bad return code.						
SQL Variables	57	58 Event Definition Detail: 56					
Vacations							
Users	59 File View Help						
Credentials							
Connections							
Security Profiles	63 Event Mail Network						
Notification Lists	65						
E System View	66	Subject	GECS Alert 56 Bad return code.				
491 Event Definitions	67						
Augus 68		Message:	Bad return code %RETCODE% from job %JOBNUM% on %SERVER%.				
	69						
	70						
	71						
	72	Send Mail To:	%USER1%	5			
	73		%USER2%	5			
	74		%USER3%	5			
	75		%USER4%	5			
	76						
	77		%USER5%	5			
	78						

- Add %USER1%, %USER2%, %USER3%, %USER4%, and %USER5%. Save your changes. This will allow GECS to substitute individual job information from the five fields of a job's "Mail" tab, if this event occurs.
- 3. The "Message" field contains the details that will be written to the file. This field can be updated. Notice the different substitution variables that can be used in the "Message" field. These variables, such as %RETCODE%, %JOBNUM% and %SERVER%, will get substituted with the values from the specific job where a failure is recorded.
- 4. Open your Batch Job and click on the "Mail" tab. Update the "GECS Users or Groups to Notify" field(s).

Batch Job: 1001_WRITE_	TO_FILE_BATCH_TES	T.JOB2				
File View Help						
🔚 🔟 Job History 🛛 🖌 🕨 🕲 🛆

GECS Users or Groups to Notify:						
	\$C:\TEMP\REPORTI	ING_SYSTEM\EXCEPTIONS LO	G S			
			5			
			5			
			5			
			5			
Include File Attachment:						

- 5. Enter \$filename or #filename. The \$ will cause the file to be appended to. The # will cause the file to be overwritten. You should include the fully qualified path and file name you need the GECS System Manager program to write. Note that the GECS System Manager user account must have Windows authority / rights to write to this file and/or directory.
- 6. Allow the GECS System to run this job. When this job fails, GECS will write to the specified file, the specific details you included in the "Message" field about the job failure.

In this example, the file will look similar to the following:

(	EXCEPTIONS.LOG - Notepad	
	File Edit Format View Help	
	Bad return code 22 from job 1001_WRITE_TO_FILE_BATCH_TEST.JOB2 on O	LIVE.
